

Pay on Arc

Subscriptions that collect themselves.

A USDC-native payment suite on Arc. Approve once — an autonomous billing agent pulls every payment when it falls due, with no wallet prompt and no human in the loop.

Crypto has no standing order.

Every on-chain payment needs a human signature at the exact moment it is due. That single constraint removes an entire category of money movement from crypto.

Subscriptions

The backbone of Web2 commerce — and absent on-chain.

Rent and payroll

Recurring by nature, impossible to schedule from a wallet.

Small plans

Gas volatility made collecting \$5 cost more than \$5.

Why it stayed unsolved

The EVM cannot push. A contract cannot initiate a transfer from a user's wallet on a schedule — no protocol can simply add recurring payments.

Pull works, but needs a keeper. Allowance-pull is the only viable model, and it only works if something reliable watches the clock and pays the gas. Most teams stop here.

Arc removes the economics. Sub-cent fees denominated in USDC and sub-second finality make a \$5/month plan worth collecting for the first time.

Three pieces, one live product.

01

ArcSub

A non-custodial subscription contract on an allowance-pull model. Funds never leave the subscriber's wallet. Each period is pulled only when due, the price is fixed at creation, and either side cancels in one transaction.

02

The billing agent

A keeper with its own wallet that watches ArcSub and collects every due payment by itself — no pop-up, no click, no human. It pays only transaction fees; subscription money moves subscriber → merchant directly.

03

Payment rails

One-time USDC payments with on-chain memos, shareable pay-links and subscribe-links, splits to 20 wallets, recallable payments, a Pyth-fed USDC/EURC treasury rebalancer, and CCIP messaging to Sepolia.

All three are deployed and verified on Arc Testnet today.

Subscriptions, settled on-chain.

Subscriptions

Billing AgentPay & LinkSplitRecallableCross-ChainTreasuryReceipts

Recurring payments, settled on-chain

No money leaves your wallet up front. You approve USDC once, and each period is pulled only when it comes due – by the merchant, by you, or by the billing agent. Cancel in one transaction, any time, from either side.

Use my address

Approve once

One USDC approval. No money moves up front.

Pulled when due

The contract charges the period, never earlier.

Both sides listed

What you fund and who subscribes to you, live.

Cancel in one click

On-chain, either party, no notice period.

A worker that bills for you.

The agent holds its own wallet, watches the subscription table every 15 seconds, batches everything due into a single charge, and reports what it did. Nobody signs anything.

[12:10:35 PM] ✓ 1 subscription(s) charged autonomously — merchants paid, next cycles scheduled.

Autonomous, verifiably

Charges on ArcSub were executed by the agent with zero human signatures.

Money never touches it

USDC moves subscriber → merchant. The agent pays gas only.

Next: hosted 24/7

Milestone 1 moves the keeper off the browser onto Circle Developer-Controlled Wallets.

The rails around it.

The subscription contract sits inside a wider payment suite. Every one of these is deployed and exercised on Arc Testnet today.

Pay & link

One-time USDC with an on-chain memo, or a shareable link that fills itself in for the payer.

Split payments

One transaction, up to 20 recipients — payroll, revenue shares, bounties.

Recallable

A payment the sender can pull back inside a window, until the recipient claims it.

Cross-chain

Chainlink CCIP from Arc to Sepolia, verified end-to-end twice.

Treasury

A Pyth-fed rebalancer holding a target USDC/EURC ratio.

Receipts

Every payment, split and recall readable back from the chain.

Everything here is on-chain today.

dApps shipped 2025–2026

Verifiable on ArcScan

- ArcSub — recurring charges executed by the agent, with no human signature on any of them.
- ArcPay V2 — live payments, splits and recallable payments, plus two end-to-end CCIP messages to Sepolia.
- Agent Forge — a self-registered ERC-8004 agent that priced, delivered and was paid for escrow jobs autonomously.
- Engineering — 60 contract tests and 45 Playwright UI tests in CI, plus a published line-by-line security review of all three contracts.

Testnet-stage by design. This grant is what takes it to production.

Built on Circle, deepening on Circle.

Integrated today

USDC on Arc

Native gas and the settlement asset for every flow in the product.

EURC on Arc

Transfers and treasury rebalancing against USDC.

Developer-Controlled Wallets

The wallet layer inside Agent Forge.

Planned

Developer-Controlled Wallets

Wallet layer for the hosted 24/7 keeper — weeks 1–6.

CCTP

Fund subscriptions with USDC from other chains — weeks 7–14.

Paymaster

Gasless subscriber onboarding — weeks 10–14.

Gateway

Evaluation in Q1 2027.

Three milestones, 30,000 USDC.

MILESTONE 1

10,000 USDC

Q3 2026 · 6 weeks

Production-ready subscriptions

Allowance caps instead of unlimited approvals, charge-window guards, pause controls, and fixes for every finding in our published review. Keeper moves off the browser onto a hosted service.

Audit-ready contracts · hosted keeper at ≥ 99% on-time collection over two weeks

MILESTONE 2

12,000 USDC

Q4 2026 · 8 weeks

Mainnet and Circle depth

Complete the audit and deploy to Arc mainnet. Integrate CCTP for cross-chain funding and Paymaster for gasless onboarding. Merchant dashboard v2 with analytics and webhooks.

Verified mainnet contracts · live CCTP funding · 5 pilot merchants

MILESTONE 3

8,000 USDC

Q1 2027 · 8 weeks

Adoption and agent marketplace

Onboard 25 merchants and 250 active subscriptions. Ship ERC-8004-identified billing agents anyone can hire, earning a fee per collection.

Public Dune dashboard · 3 case studies · open-source keeper SDK

Every milestone is payable against a deliverable that can be verified on-chain.

From working prototype to production infrastructure.

Security audit

A professional audit of ArcSub and ArcPay before real funds touch them. Our published review and the 105-test suite are the preparation, not the substitute.

Full-time focus

Two quarters of undivided work on the product.

Hosted keeper

Billing that no longer depends on an open browser tab.

Merchant onboarding

Incentives for the first cohort.
